

ORGANA CBD INFUSED EDIBLES

Cannabidiol, also known as CBD, is quickly becoming one of the most in-demand cannabinoid supplements on the market. Though it is a product of the cannabis plant, unlike THC, CBD does not present with a psychotropic high. Instead, it is ideal for individuals looking to relax and unwind, and not those hoping to have an intense, out of mind experience. Since recreational marijuana usage is now legal in Canada, people are now able to talk openly and freely regarding their preferred ingestion methods.

Long-Lasting Effects

Though it might take longer for CBD edibles to kick in – anywhere between 30 minutes to two hours – the result is that the effects last longer than with inhalation. Generally, with edibles, the compound is combined with other food products. As a result, the CBD is released more slowly and over an extended period as food is digested. Because of this fact, many people make the rookie mistake of ingesting more than they should because they don't believe that the edibles are working, or they haven't felt anything yet. It's a lesson we all must learn at least once! With the compound's longer release time, CBD edibles can last upwards of two to four hours longer than inhaled CBD.

CBD is Non-Psychotropic

Although CBD is a cannabis compound, many are surprised to find that, when ingested, it does not cause a psychotropic effect. The reason for this is because it is incapable of making a person feel high. CBD is derived from hemp, not marijuana. Unlike marijuana, hemp contains trace amounts of THC that it will not get the user high. Instead, the compound offers an easy-going uplift in the user's mood with a more alert, positive energy. As a result, CBD edibles provide an excellent alternative for those looking to enjoy the benefits of cannabis, but who want to avoid the extreme psychoactive experience.

Less Lung Irritation

Though the popularity of vaporizer pens is massive and still on the rise, the long-term health consequences of inhaling hot oil are still undetermined. Plus, many vape pens also possess thinning agents including propylene glycol (PG) and polyethyleneglycol (PEG) which could potentially produce harmful carcinogens when heated to temperatures above 224°C. It is possible to find vapor pens that do not contain these agents (Organa CBD Vape Pens). However, CBD edibles present an excellent alternative to inhaling potential toxins.

Pain Relief

The analgesic properties of CBD limit the brain's capacity to receive pain signals from the nervous system while the anti-inflammatory characteristics minimize inflammation throughout the body, decreasing pain and swelling. Many people use this cannabinoid as a pain reliever because CBD can be taken daily in relatively large doses without significantly affecting mental functions. CBD also has a far lower addiction risk than other prescribed pain medications. As well, CBD edibles present a far safer method of ingestion that could decrease future health complications.
